4. TROUBLESHOOTING 21

5. CIRCUIT DIAGRAM 27

6. COMPONENT PARTS LIST

1. OUTLINE

This manual has been written to provide guidance for troubleshooting of the OKIPAGE4w Plus Printer (primarily for its printed circuit boards), on an assumption that the reader is knowledgeable of the printer. Read the maintenance manual for this printer P/N M-521426 if necessary.

Note:

1. High voltage power supply board and power supply unit containing a high voltage power supply is dangerous. From the viewpoint of the safety standards, the local repairing of a defective board is not allowed. Thus, the objects to be locally repaired as a result of troubleshooting are switches and fuses.

2. TOOLS

For troubleshooting the printer, the tools listed below may be needed in addition to general maintenance tools.

Tool	Remarks
Oscilloscope	Frequency response 100 MHz or higher
Soldering iron	A slender tip type, 15-20 watts
Extension code kit	P/N : 40105501

3. CIRCUIT DESCRIPTION

3.1 Outline

The circuit of OKIPAGE4w Plus consists of a main control board, a high voltage power supply board and a power supply unit. The block diagram is shown in Fig. 3-1. The main control board controls the reception and transmission of data with a host I/f and processes command analysis, bit image development, raster buffer read. It also controls the engine and high voltage outputs.

(1) Reception and transmission control
The main control board has one parallel I/F port which is compliant to the IEEE 1284 specification.
An interface task stores all data received from the host into a receive buffer first, and returns the printer status upon request of the host.

(2) Command analysis processing
The OKIPAGE4w Plus printer has the following emulation mode.
Hiper-W: OKI original
An edit task fetches data from the receive buffer, analizes commands, and sets I/O registers.

(3) Raster data processing
The decompression circuit in the CPU expands the compressed data and stores the data into the raster buffer.

(4) Raster data transfer
The LED head control circuit in the CPU sends the data stored in the raster buffer to the LED head.

(5) High voltage control
The high voltage control circuit in the CPU.

The high voltage power supply board generates high voltage outputs, and have sensors, LED for display.
The power supply unit generates +24VDC output, +5DC output.

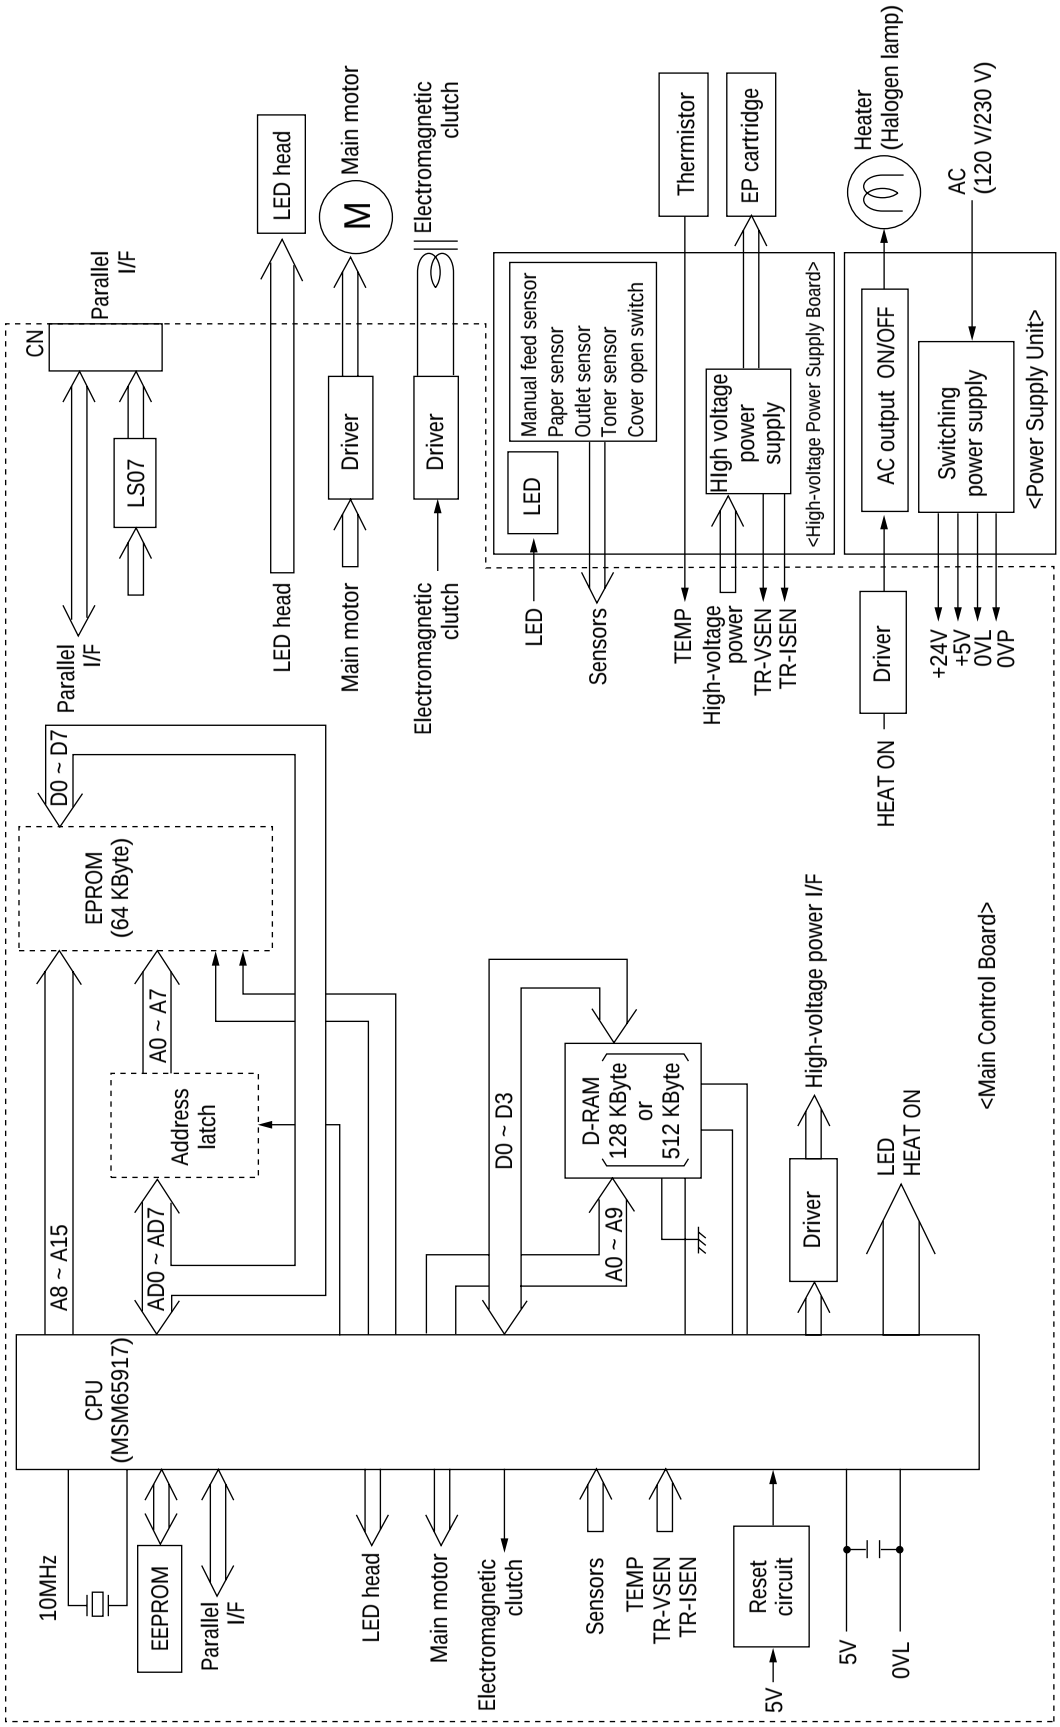

Figure 3-1 OKIPAGE4w Plus Block Diagram

3.2 CPU and Memory

(1) CPU (MSM65917)

CPU core	nX-8
CPU clock	10 MHz
Data bus width	External 8 bits, Internal 8 bits

(2) Program ROM

ROM capacity	64k-bytes (512-kbit EPROM)
ROM type	512 kbits (64k x 8 bits)
Access time	150 nsec

When mask ROM in the CPU is valid, the EPROM is not mounted.

(3) Resident RAM

RAM capacity	128k bytes (256k x 4 bits D-RAM one piece) or 512k bytes (1M x 4 bits D-RAM one piece)
RAM type	1M bits (256k x 4 bits) or 4M bits (1M x 4 bits)
Access time	70 ns, 60 ns

The block diagram of CPU and memory circuit is shown in Fig. 3-2.

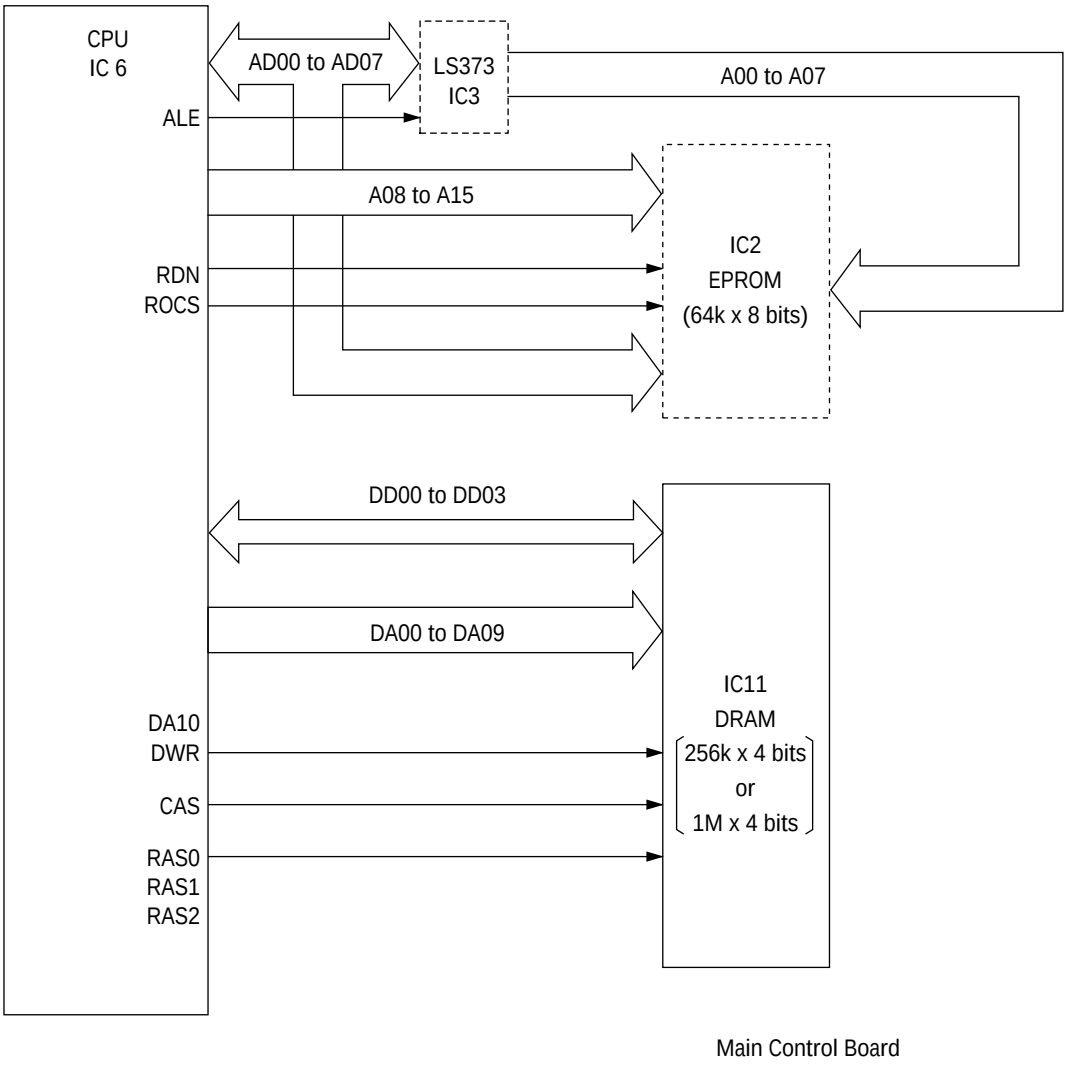

Figure 3-2 Block Diagram of CPU & Memory in OKIPAGE4w Plus

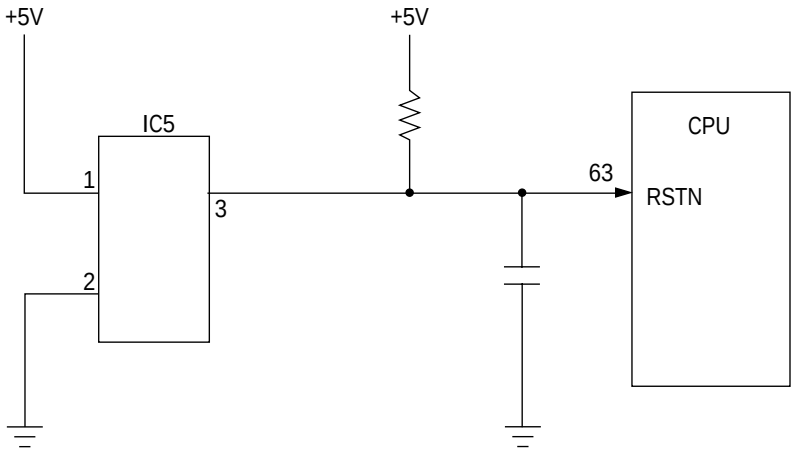
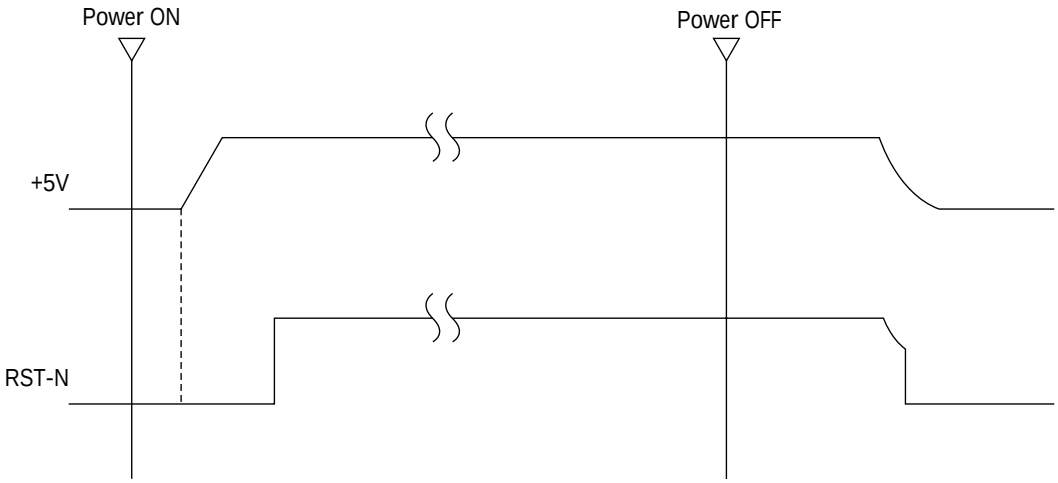
3.3 Reset Control

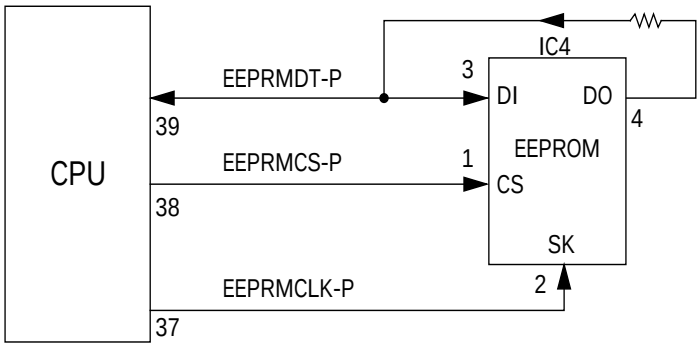
When power is turned on, RST-N signal is generated by IC5.





3.4 EEPROM Control

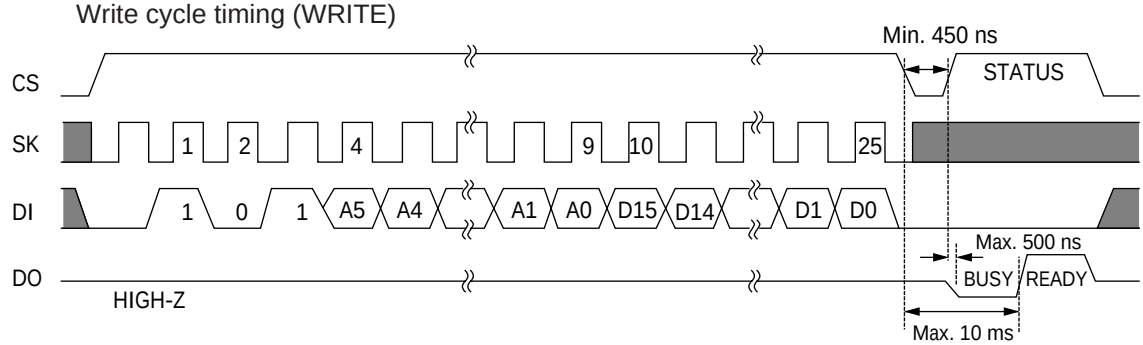
The BR93LC46A on the main control board is an electrical erasable/programmable ROM of 64-bit x 16-bit configuration. Data input to and output from the ROM are bidirectionally transferred in units of 16 bits through I/O port (EEPRMDT-P) in serial transmission synchronized with a clock signal from the CPU.



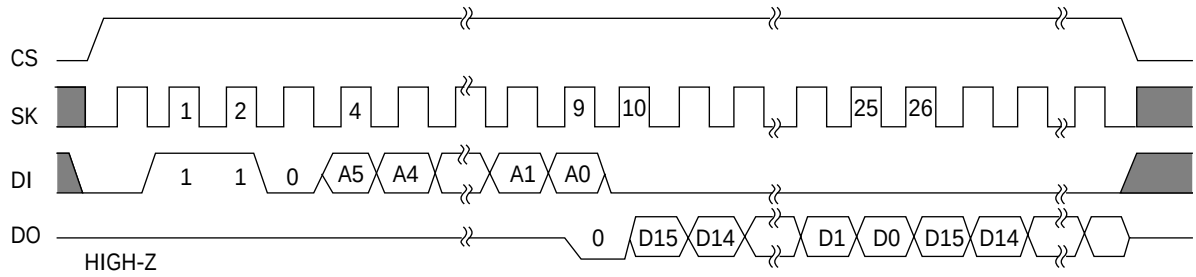
The EEPROM operates in the following instruction modes.

Instruction	Start bit	Operation code	Address	Data
Read (READ)	1	10	A5 to A0	
Write Enabled (WEN)	1	00	11XXXX	
Write (WRITE)	1	01	A5 to A0	D15 to D0
Write All Address (WRAL)	1	00	01XXXX	D15 to D0
Write Disabled (WDS)	1	00	00XXXX	
Erase	1	11	A5 to A0	
Chip Erasable (ERAL)	1	00	10XXXX	

Write cycle timing (WRITE)

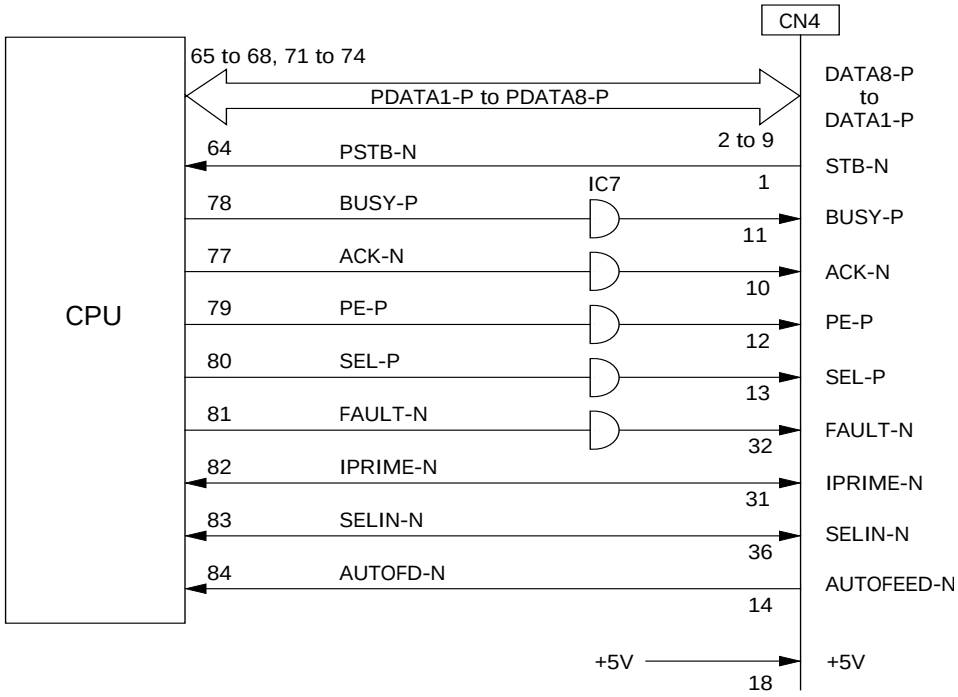


Read cycle timing (READ)



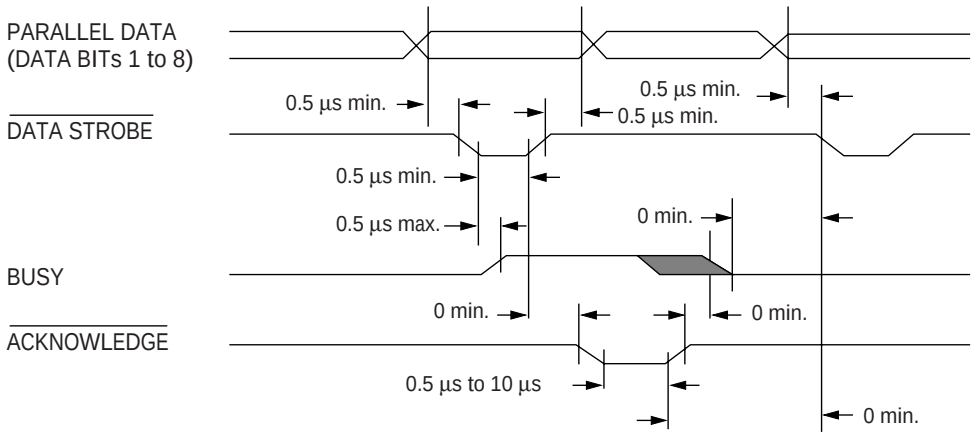
3.5 Parallel Interface

Parallel data is received from a host system via parallel interface which is compliant to the IEEE1284 specification.



Compatible mode

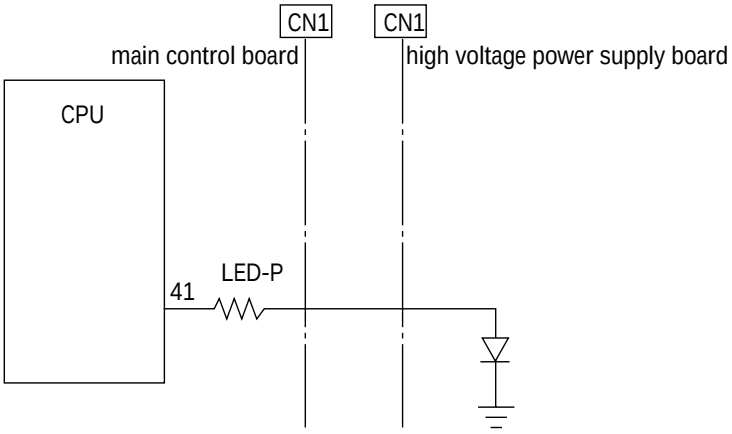
The CPU sets a BUSY-P signal to ON at the same time when it reads the parallel data (PDATA1-P to PDATA 8-P) from the parallel port at the fall of PSTB-N signal. Furthermore, it makes the store processing of received data into a receive buffer terminate within a certain fixed time and outputs an ACK-N signal, setting the BUSY-P signal to OFF.



3.6 LED Lamp Control

There is an LED lamp on the high voltage power supply board which is connected to and controled by the CPU on the main control board.

The light from the LED lamp can be seen on the Lens Cover through the LED Lens.



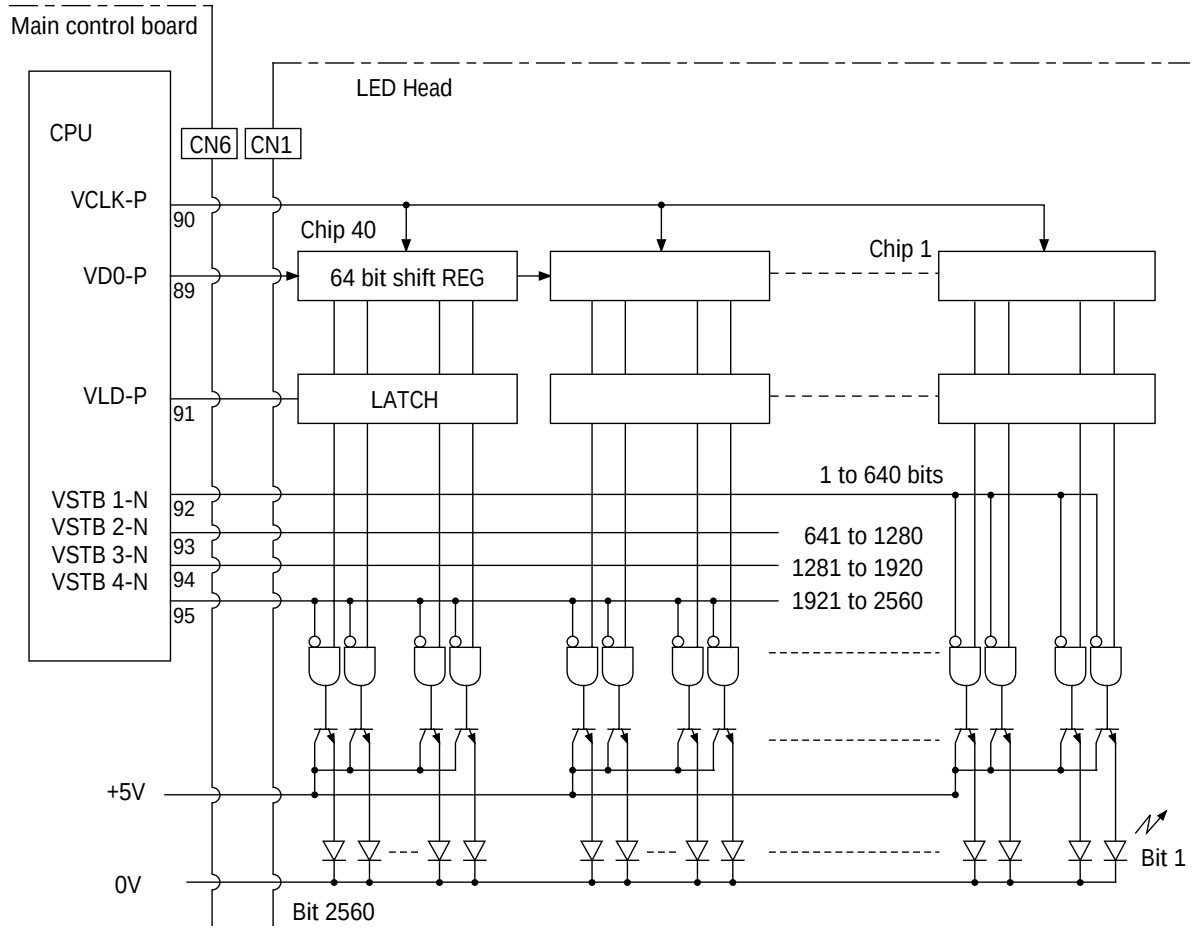
3.7 LED Head Control

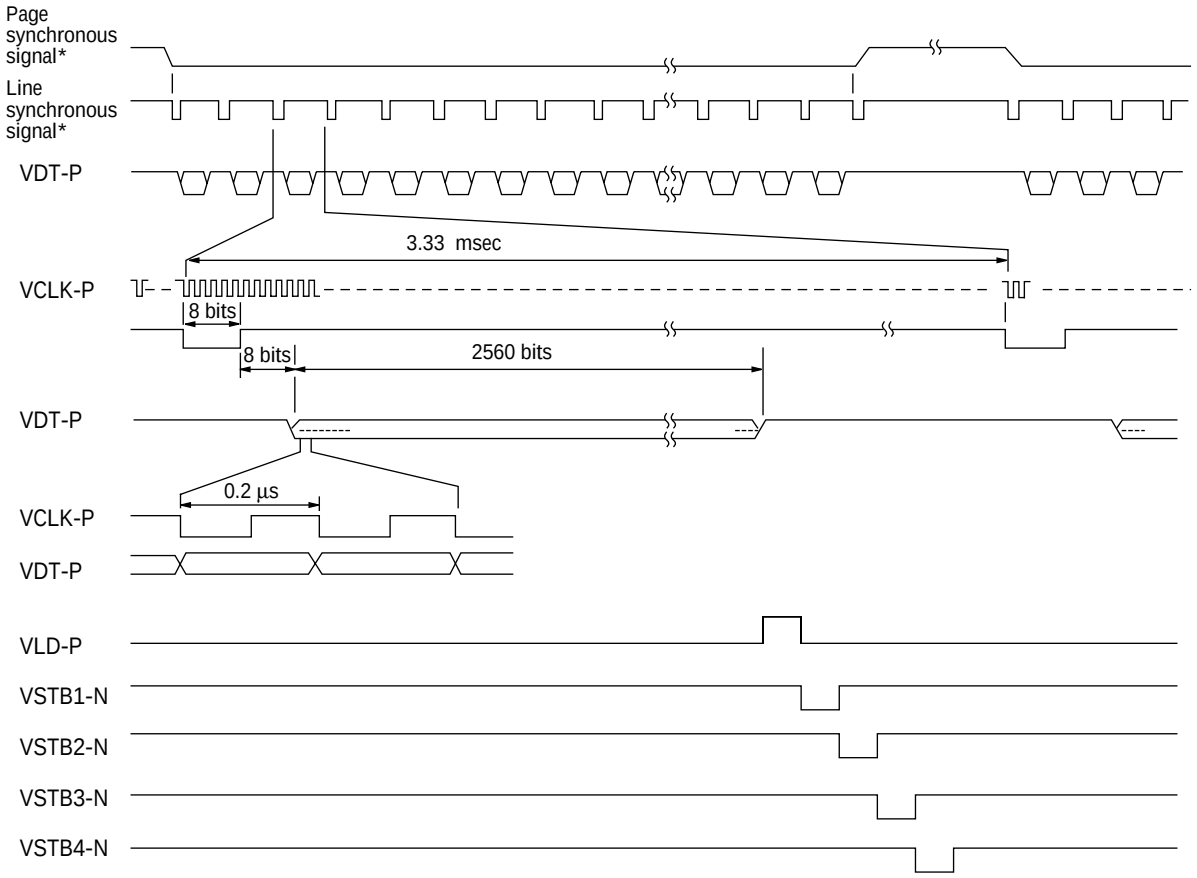
When a paper form is made to arrive at the data write position on print start, the sending of data to the LED head starts as synchronized with the page synchronous signal/line synchronous signal (CPU internal signal).

Bit image data developed on the raster buffer in the CPU are DMA-transferred to the register of a video interface controller (CPU built-in) and then sent to the shift register of the LED head in a serial transmission synchronized with the VCLK-P signal by the VD0-P signal.

When 1-dot line data (2560 bits) is completely shifted, it is latched by means of the VLD-P signal, causing LEDs to be driven by the VSTB1-N through VSTB4-N signals in different timing for each signal.

Some of LED heads have 2496 dots rather than 2560 dots. The controls regarding the number of dots are adjusted to the LED head installed when the printer is shipped from the factory.

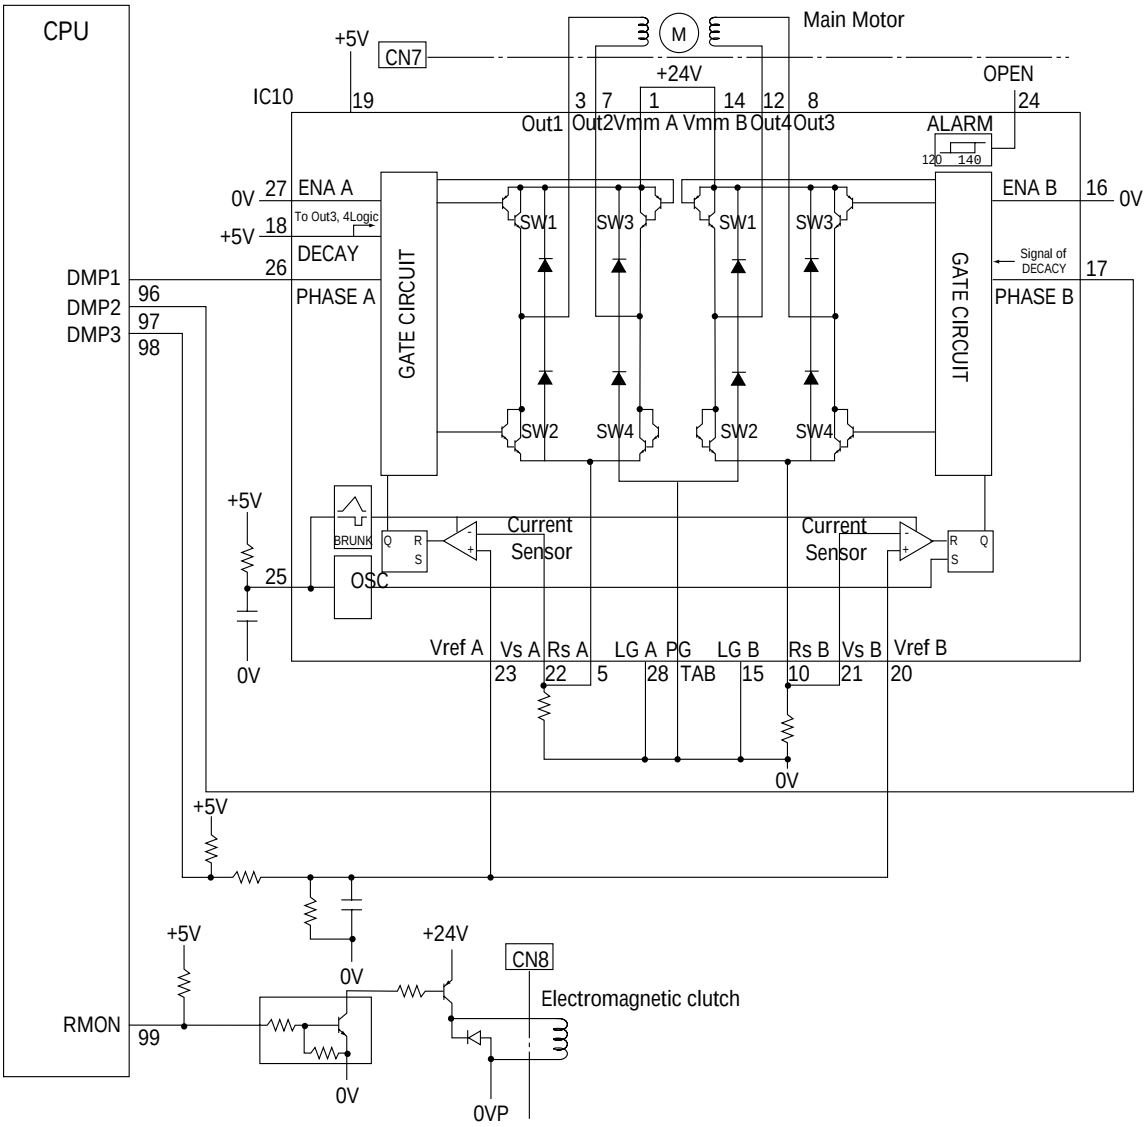




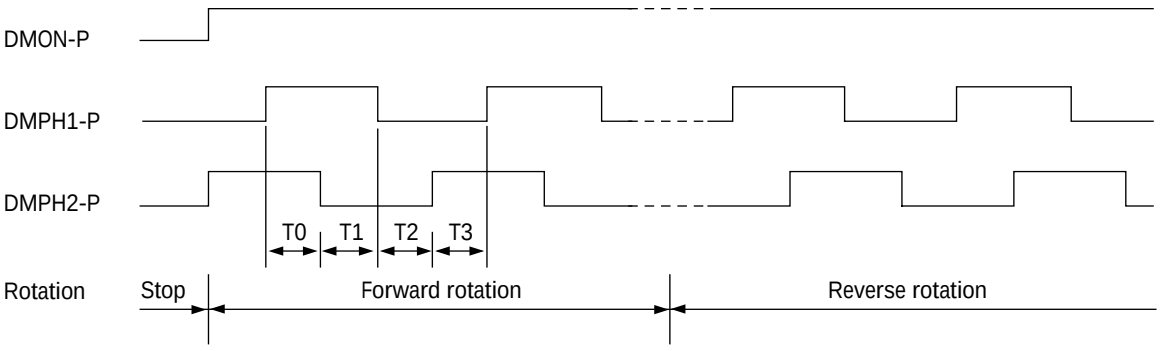
* CPU internal signal

3.8 Motor and clutch control

The electromagnetic clutch is driven by a control signal from the CPU and the drive circuit shown below.
The main motor is driven by the control signals from the CPU and the driver IC.



(1) Main motor



Operation at normal speed: T0 to T3 = 1.515 ms

(2) Motor drive control

Time T0 to T3 determines the motor speed, while the phase different direction between phase signals DMPH1-P and DMPH2-P determines the rotation direction. DMON-P signal control a motor coil current. According to the polarity of the phase signal, the coil current flow as follows:

1) +24V $\rightarrow$ SW1 $\rightarrow$ motor coil $\rightarrow$ $\overline{SW4}$ $\rightarrow$ resistor $\rightarrow$ earth, or,

2) +24V $\rightarrow$ $\overline{SW3}$ $\rightarrow$ motor coil $\rightarrow$ SW2 $\rightarrow$ resistor $\rightarrow$ earth

The drop voltage across the resistor is input to comparator, where it is compared with a reference voltage. If an overcurrent flows, a limiter operates to maintain it within a certain fixed current.

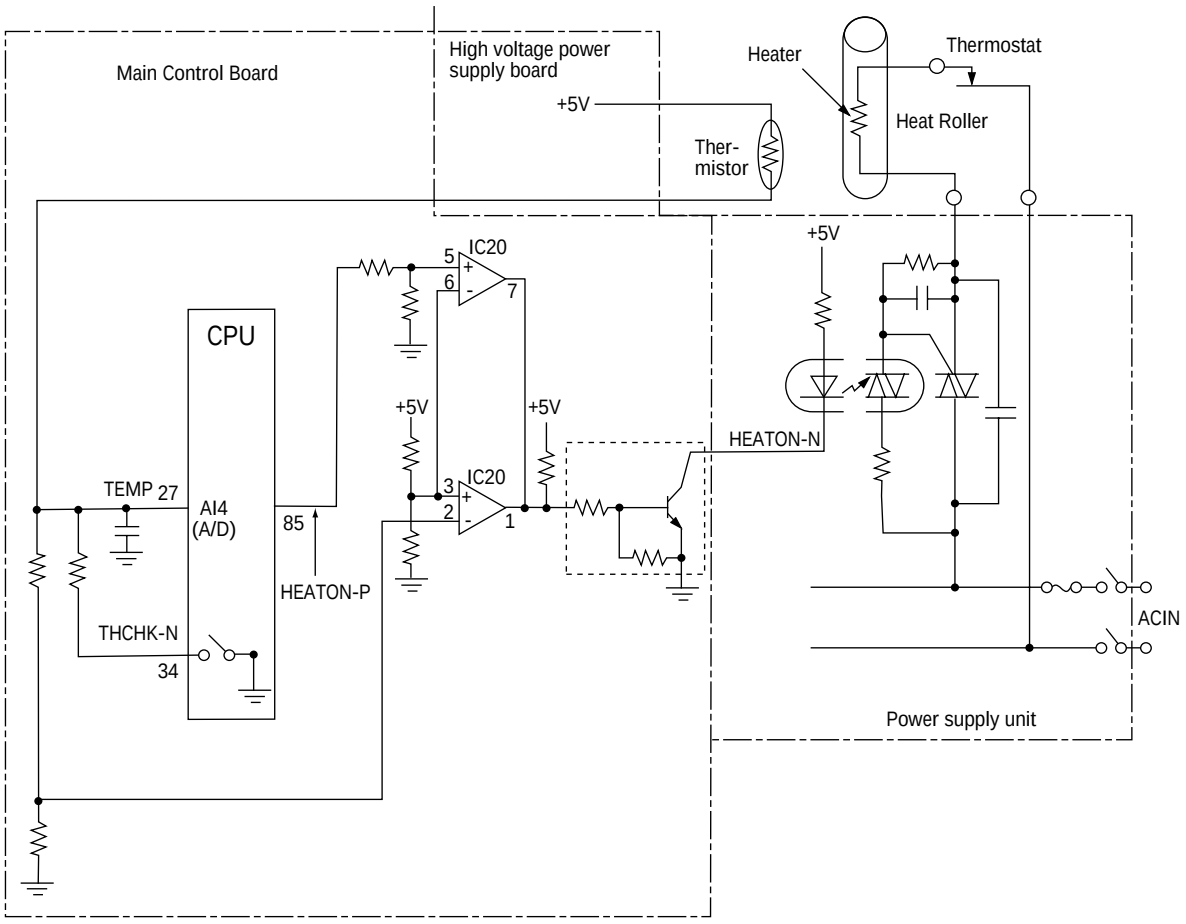
(3) Electromagnetic clutch control

Mechanical operation mode is switched by the combination of the clutch status and the direction of motor rotation.

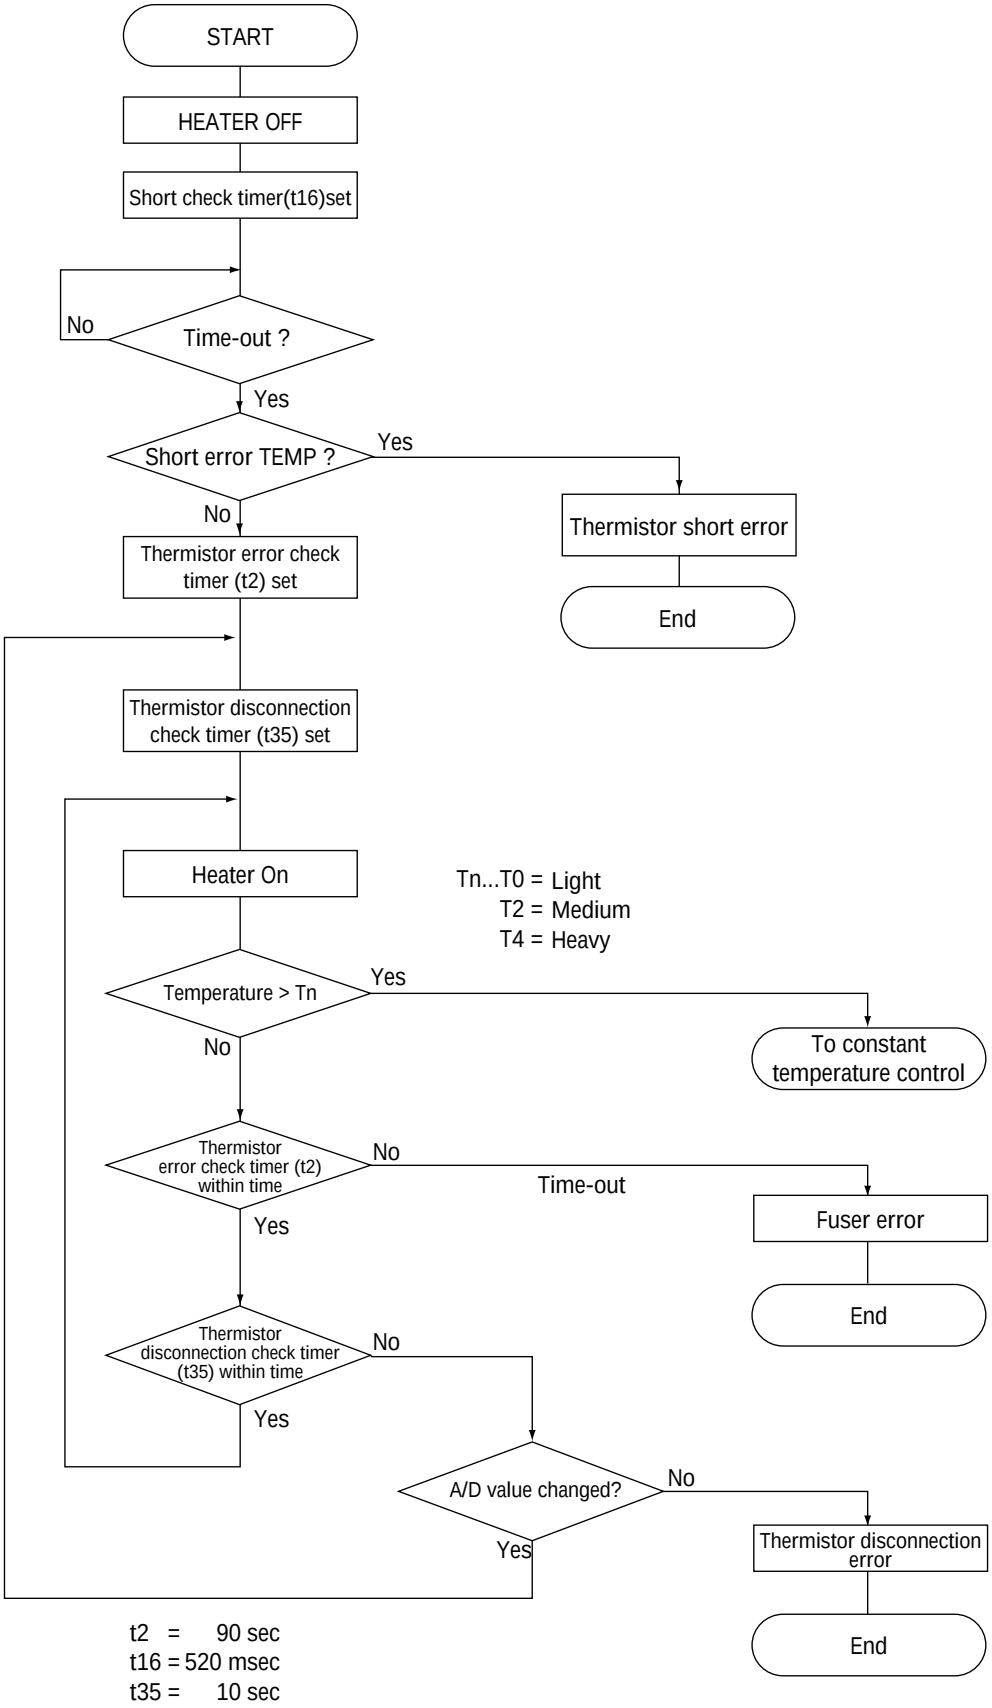
clutch status	rotation direction	operation mode
off	Forward	cleaning
off	Reverse	Hopping from manual feed slot
on	Forward	illegal operation
on	Reverse	Hopping from tray

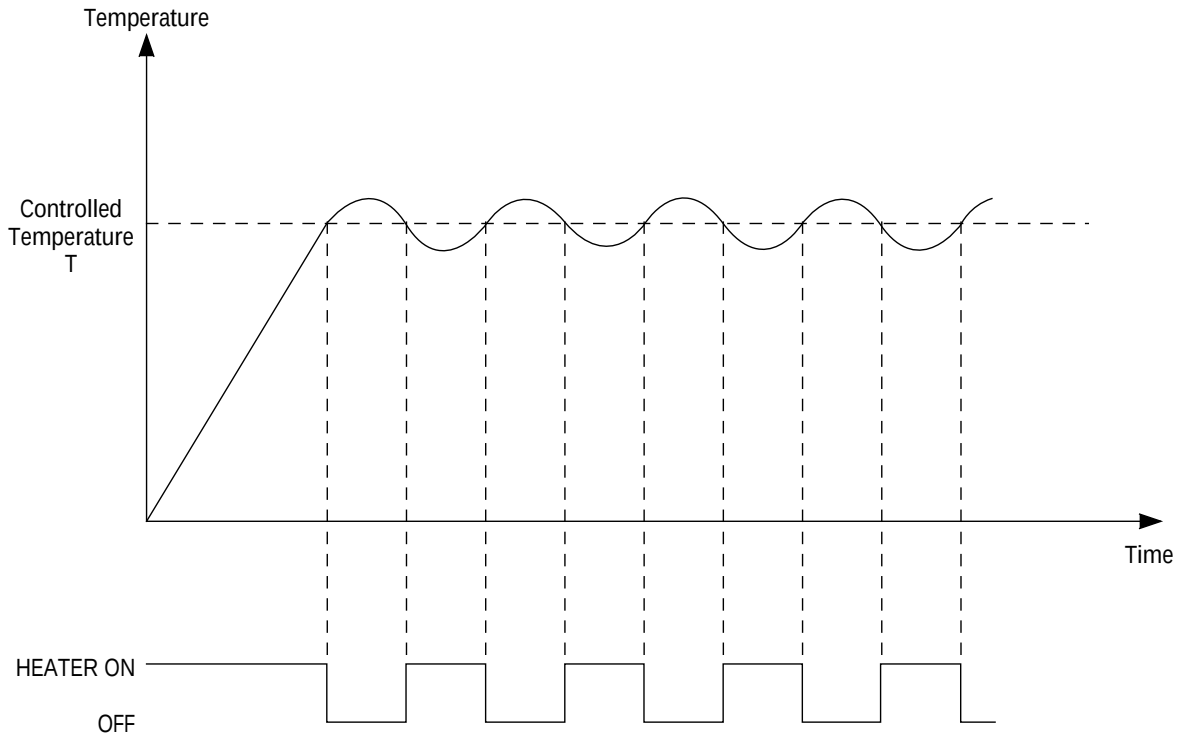
3.9 Fuser Temperature Control

The temperature change in a heat controller is converted into the electric potential TEMP corresponding to the change in the resistance value of a thermistor, and the resultant potential is fed back to the control circuit. The CPU performs ON/OFF control of the HEATON-P signal to keep the heat roller temperature constant in accordance with the state at which the thermistor voltage (TEMP) is read into directly by the AD converter of the CPU.
THCHK-N signal is fixed to “0”.
When the paper thickness is set on the menu of the host, the temperature is adjusted to the targeted thickness accordingly.



Flowchart of Thermistor Circuit Check





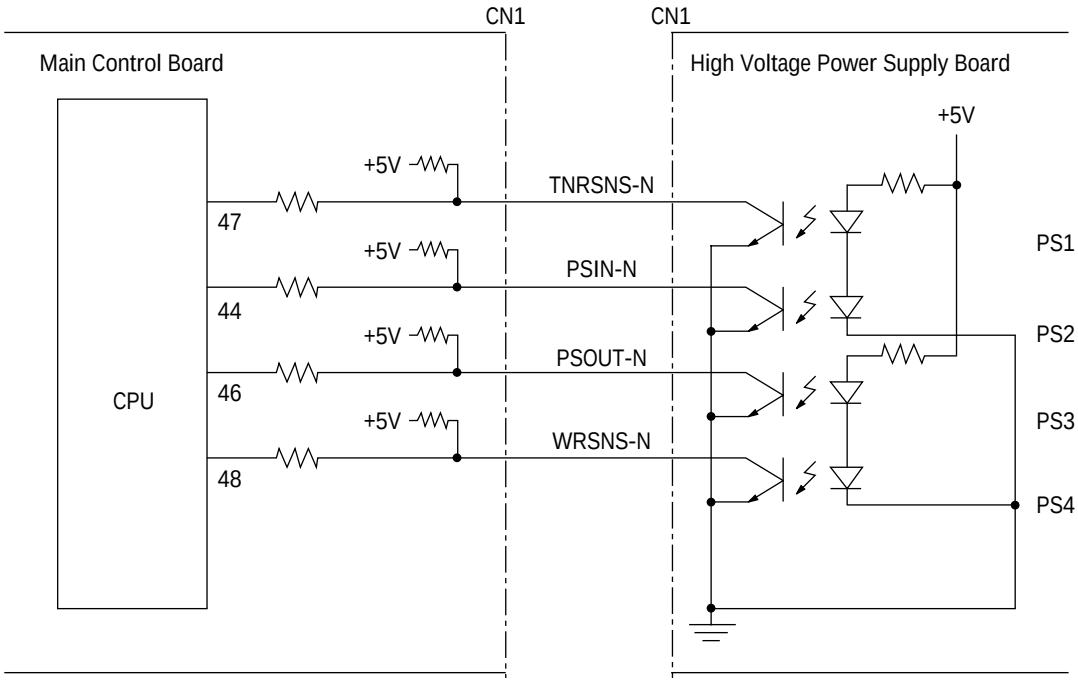
Temperature table

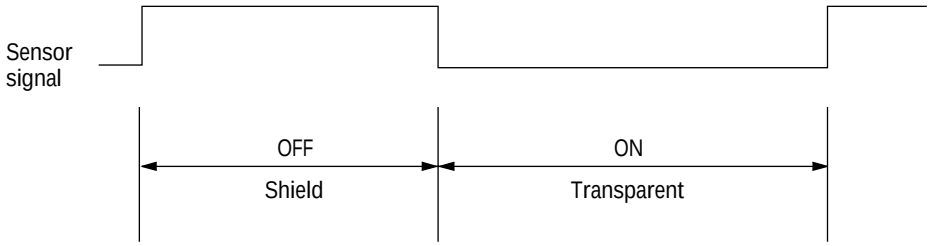
THCHK-N	Heater control mode
O	Normal operation
Z	Not used

T Paper Thickness
145˚C: light
150˚C: medium light
155˚C: medium
160˚C: medium heavy
165˚C: heavy

3.10 Sensor Control

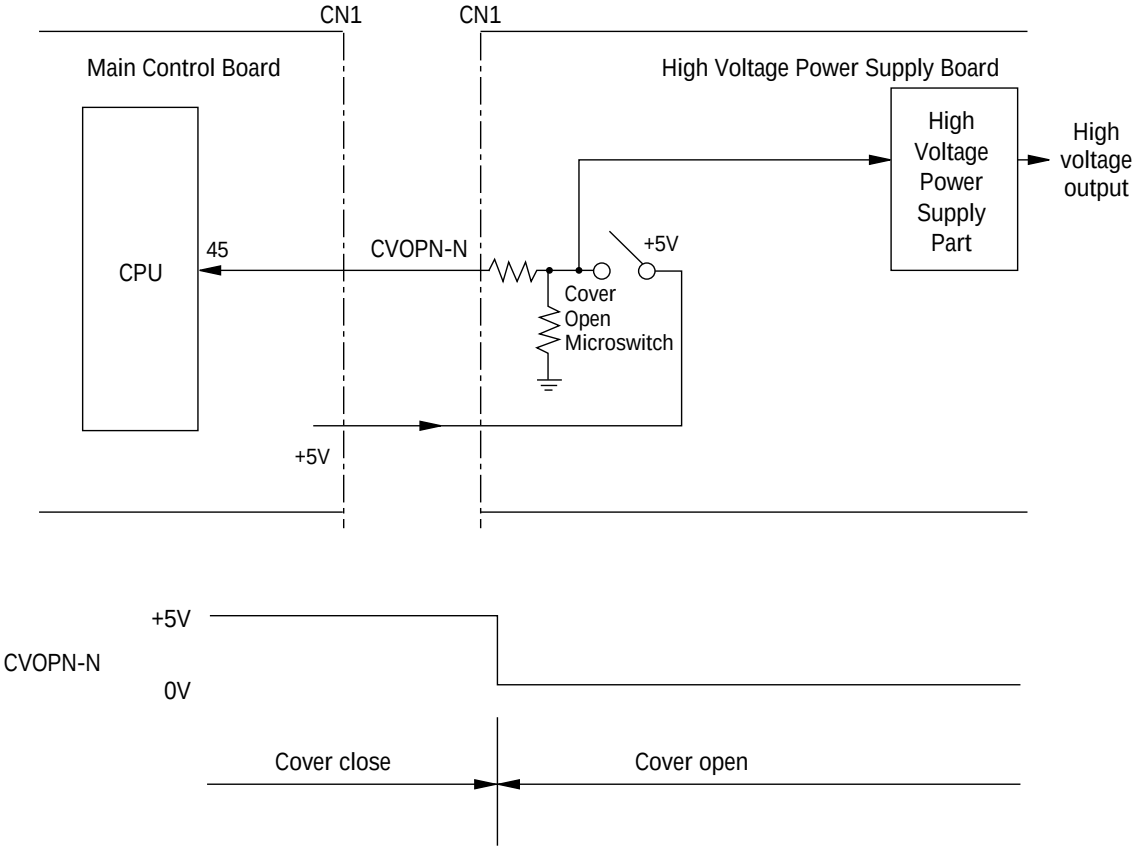
The CPU supervises the state of each sensor every 40 ms.





3.11 Cover Open

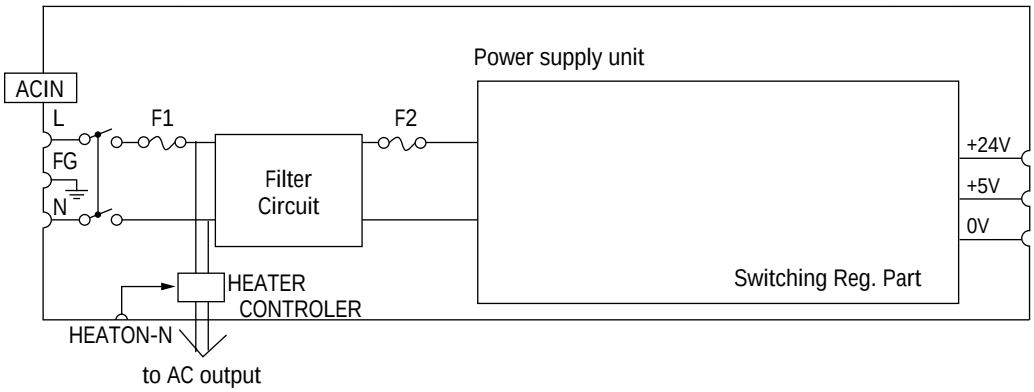
When the cover is opened, a cover open microswitch is opened. This makes a CVOPN-N signal low, thereby the CPU detects that cover is open. Furthermore, opening the cover stops applying a +5V power to the high voltage power supply part, resulting in stopping all high voltage outputs.



3.12 Power Supply Part

(1) Power supply unit

An AC power from an inlet is input to Switching Reg. part .AC power is converted to a +24 VDC output and +5 VDC output.

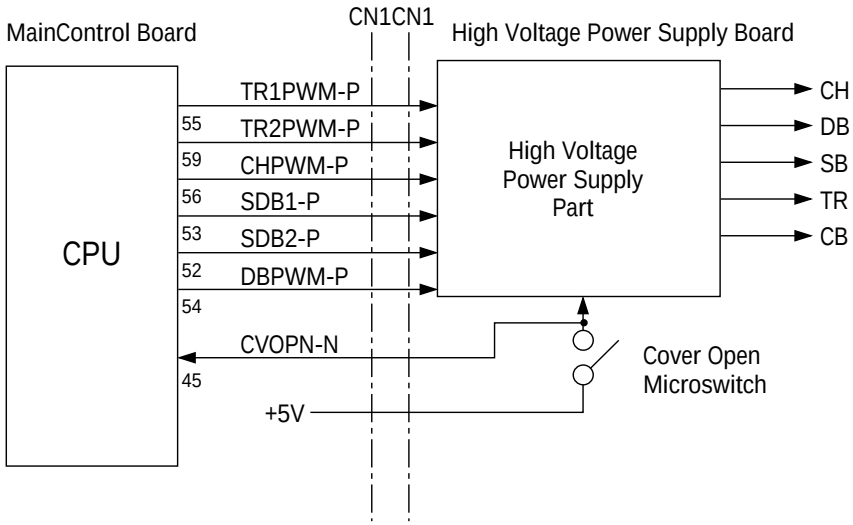


Fuse Ratings

AC Input / Fuse	230 V	120 V
F1	250 V 6.3 A	125 V 10 A
F2	250 V 2 A	250 V 2 A

(2) High voltage power supply board

The +5 VDC power supplied to the high voltage power supply part via the cover open microswitch as source voltage. The high voltage power supply part supplies necessary voltage for electro-photography print to output terminals CH, DB, SB, TR, and CB according to a control signal from the CPU. The table on the next page shows the relationship between control signals and high voltage outputs.



Control Signals and High Voltage Outputs

Control signal name	Level	Function
TR1PWM-P	H/L (PWM)	Makes the part put out a power (+3 to 5 μA / +0.5 to 4 KV) to TR.
	L	———
TR2PWM-P	H/L(PWM)	Makes the part put out a -750V power to TR.
	L	———
CHPWM-P	H/L(PWM)	Makes the part put out a -1.35 KV power to CH.
	L	———
SDB1-P	H	Makes the part put out the following power: +450V or 0V power to SB +300V power to DB
	L	———
SDB2-P	H	Makes the part put out the following power: -450V power to SB -300V power to DB +400V power to CB
	L	———
DBPWM-P	H/L(PWM)	Makes the part put out the power to SB, DB, CB.
	L	———

4. TROUBLESHOOTING

4.1 Troubleshooting Table

(A) High Voltage Power Supply Board

Note: A malfunction of the power supply is not repaired by an agency. The abnormality to be treated here is that of sensors only.

Failure	PC Display Message	Flowchart No.
A paper input jams occur frequently.	PAPER INPUT JAM	A - 1
A paper feed jams occur frequently.	PAPER FEED JAM	A - 2
A paper-exit jams occur frequently.	PAPER EXIT JAM	A - 3
A paper size errors occur frequently.	PAPER SIZE ERROR	A - 4
Paper can not be fed from the manual feed slot .		A - 5
The message "COVER OPEN" remains displayed on the PC display.	COVER OPEN	A - 6
The message "TONERLOW" remains displayed on the PC display.	TONER LOW	A - 7
The message "TONERSNS" remains displayed on the PC display.	TONER SENSOR	A - 8

(B) Main Control Board

Failure	PC Display Message	Flowchart No.
Initialization error and not restored	INITIALIZATION ERROR	B - 1
Program ROM error	ROM CHECK ERROR	B - 2
Resident RAM error	RAM CHECK ERROR	B - 3
EEPROM error	EEPROM CHECK ERROR	B - 4
Fuser error	FUSER ERROR	B - 5
Watchdog timer timeout occurs frequently.	WATCHDOG TIMER ERROR	B - 6
Data sent through the Parallel I/F cannot be received.	INITIALIZATION ERROR	B - 7

4.2 Troubleshooting Flowchart

A-1 Paper input jams occur frequently.

- Is PS4 (Write Sensor) operating normally?
  - No Replace PS4.
- Yes Is Pin1 of CN8 in main control board operating normally?
  - No Replace Q4 or Q5 in main control board.
- Yes Failure of IC6 (MSM65917) in main control board.

A-2 A paper feed jams occur frequently.

- Is PS4 (Write Sensor) operating normally?
  - No Replace PS4.
- Yes Is PS3 (Outlet Sensor) operating normally?
  - No Replace PS3.
- Yes Failure of IC6 (MSM65917) in main control board.

A-3 A paper exit jams occur frequently.

- Is PS3 (Outlet Sensor) operating normally?
  - No Replace PS3.
- Yes Failure of IC6 (MSM65917) in main control board.

A-4 A paper size errors occur frequently.

- Is PS4 (Write Sensor) operating normally?
  - No Replace PS4.
- Yes Failure of IC6 (MSM65917) in main control board.

A-5 Paper can not be fed from manual feed slot.

- Is PS2 (Manual Feed Sensor) operating normally?
  - No Replace PS2.
- Yes Failure of IC6 (MSM65917) in main control board.

A-6 The message “COVER OPEN” remains displayed on the PC display.

- Is CVSW (Cover Open Switch) operating normally?
  - No Replace CVSW.
- Yes Failure of IC6 (MSM65917) in main control board.

A-7 The message “TONERLOW” remains displayed on the PC display.

- Is PS1 (Toner Sensor) operating normally?
  - No Replace PS1.
- Yes Failure of IC6 (MSM65917) in main control board.

A-8 The message “TONERSNS” remains displayed on the PC display.

- Is PS1 (Toner Sensor) operating normally?
  - No Replace PS1.
- Yes Failure of IC6 (MSM65917) in main control board.

B-1 Initialization error and not restored

- Replace IC2.
- OK?
- No — Is the 10-MHz clock signal being put out to pin 3 of OSC1?
  - No — Replace OSC1 (CST 10.0MTW).
- Yes — Failure of IC6 (MSM65917)

B-2 Program ROM error

- Replace IC2.

B-3 Resident RAM error

- Are negative pulses being put out to Pin 4 , 23 (RAS0-N , CAS-N) of IC11?
  - No — Failure of IC6 (MSM65917)
- Yes — Are the signals at pins, 9 TO 12 , 14 TO 18 , 5 (DA00-P to DA09-P) of IC11 being changed?
  - No — Failure of IC6 (MSM65917)
- Yes — Replace IC11.

B-4 EEPROM error

- Replace IC4.
- OK?
- No — Failure of IC6 (MSM65917)

B-5 Fuser error

- Is the heater on?
  - No — Is the voltage at Pin 40 (HEATON-P) of IC6(MSM65917) 5V?
    - Yes — Replace Q3 or IC20
- No — Failure of IC6 (MSM65917)

B-6 Watchdog timer timeout occurs frequently.

- Replace IC2.
- OK?
- No — Failure of IC6 (MSM65917)

B-7 Data sent through the Parallel I/F cannot be received.

- Is the signal at Pin 11 (BUSY-P) of CN4 being at low level?
  - No — Is the signal at Pin 13 (BUSY-P) of IC7 (7407) changed as shown below, at data reception?

	ON-LINE	OFF-LINE
BUSY-P	Low	High

    - No — Failure of IC6 (MSM65917)
    - Yes — Replace IC7 (7407).
  - Yes — Is the level of the signal at Pin 1 (STB-N) of CN4 changed at data reception?
    - No — Make sure of the connection of I/F cable or the operation of the h ost computer.
  - Yes — Are the signals at Pin 1 (ACK-N), Pin 9 (FAULT-N) of IC7 (7407) being respectively at low level and high level in on-line mode?
    - No — Replace IC7 (7407).
    - OK?
    - No
  - Yes — Failure of IC6 (MSM65917)
